

Built-In Finger Print Technology

Order or Upgrade to Built-in Finger Print Technology

We now offer an updated version of our built-in finger print reader. Like its predecessor, this design combines PIN and finger print identification for added security. GFMS incorporates all aspects of finger print identification in addition to operating asset management devices. GFMS's database seamlessly stores finger print data within each user profile and distributes those identities to other built-in finger print devices.

Existing GFMS customers looking to add a finger print reader to their system will appreciate the ease of installation with this design. A simple exchange of displays can be performed on-site without the need of a complicated upgrade. Currently our SWAT Box and Security Asset Manager product lines both support this built-in biometric.

Other ID Devices

Key Systems can provide you with any number of ID device solutions or adapt our products to work with your existing access control system. Some other options include but are not limited to other biometric devices, proximity and mag stripe card ID.

Enroll Globally

In addition to enrolling at any Security Asset Manager within your GFMS network, we also offer a separate Enrollment Station. This allows the GFMS administrator to enroll each user through a computer using the GFMS software and our USB Fingerprint Reader. We recommend this tool should you have a large number of users to enroll.

*The software stores points of data and not a scan of the actual fingerprint.
