

HANDCUFF SECURITY ASSET MANAGER

TAKE CONTROL OF YOUR ORGANIZATION'S HANDCUFFS.

The GFMS Handcuff Control Device manages local and distributed access to handcuffs using high-security, electronically-controlled metal retaining arms. Locked securely into place, handcuffs are only released to authorized users with active PINs. Each position is individually numbered, and can be assigned to one or more users.

As with all Key Systems, Inc. GFMS solutions, the Handcuff Control Device features fully-encrypted browser-based technology, enabling remote control, monitoring, and programming of each cabinet through a local area network, or over the World Wide Web.

Work Smarter.

Work Safer.
